08/12/2004 14:28 WMA → USPTO NO.454 P05

## <u>in the claims</u>

## Claims 1-33 Cancelled

- 34. (Currently Amended) A multi-tier system for digital radio communication, comprising:
  - a processor-based host adapted to control a remote unit;
  - a first-tier base station communicatively coupled to the host, wherein the first-tier base station operates in accordance with a first communications protocol;
  - a first second-tier base station communicatively coupled to the first-tier base station,

    wherein the first second-tier base station and the first-tier base station

    communicate using the first communications protocol; and
  - a second second-tier base station wirelessly coupled to the first second-tier base station, wherein the second second-tier base station is intermediate the first second-tier base station and the remote unit, and wherein the first second-tier base station is capable of communicating with the second second-tier base station without an intervening first-tier base station using a different communications protocol from the first communications protocol,
  - wherein the host is adapted to control the remote unit through the first-tier base station, the first second-tier base station, and the second second-tier base station.
- 35. (Previously presented) A multi-tier system for digital radio communication, comprising:

- a processor-based host adapted to control a remote unit;
- a first-tier base station communicatively coupled to the host;
- a first second-tier base station communicatively coupled to the first-tier base station; and
- a second second-tier base station wirelessly coupled to the first second-tier base station, wherein the second second-tier base station is intermediate the first second-tier base station and the remote unit, and wherein the first second-tier base station is capable of communicating with the second second-tier base station without an intervening first-tier base station,
- wherein the host is adapted to control the remote unit through the first-tier base station, the first second-tier base station, and the second second-tier base station.
- wherein the second second-tier base station is adapted to go into a sleep mode for a preselected interval, wherein before entering the sleep mode, the second second-tier base station transmits an indication representative of the duration of the preselected interval to the remote unit.
- 36. (Previously presented) The system of claim 35, wherein the duration of the preselected interval is defined by a start and end time of the preselected interval.
- 37. (Previously presented) The system of claim 34, wherein the second second-tier base station is adapted to:

buffer data intended for the remote unit;

transmit an indication at predetermined intervals to inform the remote unit of the presence of buffered data;

receive a request from the remote unit; and

provide the buffered data to the remote unit in response to receiving the request from the remote unit.

- 38. (Previously presented) The system of claim 34, wherein the remote unit comprises a data collection device.
- 39. (Previously presented) The system of claim 34, wherein the remote unit comprises a bar code reader or an RFID reader.
- 40. (Previously presented) The system of claim 34, wherein the remote unit comprises at least one of a vending machine, door locking mechanism, computer peripheral, thermostat, and pager.
- 41. (Previously presented) The system of claim 40, wherein the remote unit comprises a computer peripheral selected from the group comprising a printer, modem, handheld terminal, point of sale station, and other serial or parallel devices.
- 42. (Previously presented) The system of claim 34, wherein said first second-tier base station is wirelessly connected to the first-tier base station.
- 43. (Previously presented) The system of claim 34, wherein the first-tier base station is wirelessly connected to the local area network.

08/12/2004 14:28 WMA → USPTO NO.454 F08

44. (Previously presented) The system of claim 34, wherein the first second-tier base station is connected to the first-tier base station through a serial port.

- 45. (Previously presented) The system of claim 34, further comprising a third secondtier base station intermediate the remote unit and the second second-tier base station, wherein the second second-tier base station communicates with the remote unit through the third second-tier base station.
- 46. (Previously presented) The system of claim 34, wherein the second second-tier base station communicates with the first-tier base station through the first second-tier base station.
- 47. (Currently Amended) A multi-tier system for digital radio communication, comprising:
  - a processor-based host adapted to control a remote unit through a control signal;
  - a first-tier base station adapted to receive the control signal from the host, wherein the first-tier base station operates in accordance with a first communications protocol;
  - a first second-tier base station adapted to receive the control signal from the first-tier base station, wherein the first second-tier base station and the first-tier base station communicate using the first communications protocol; and
  - a second second-tier base station wirelessly coupled the first second-tier base station,
    wherein the second second-tier base station is intermediate the first second-tier

08/12/2004 14:28 WMA → USPTO NO.454 P09

base station and the remote unit, and wherein the second second-tier base station is adapted to receive the control signal from the first second-tier base station using a different communications protocol from the first communications protocol and to provide the control signal to the remote unit.

- 48. (Previously presented) The system of claim 47, further comprising a third secondtier base station intermediate the second second-tier base station and the remote unit, wherein the second second-tier base station provides the control signal to the third second-tier base station, which then provides the control signal to the remote unit.
- 49. (Previously presented) The system of claim 47, wherein the second second-tier base station is adapted to go into a sleep mode for a preselected interval, wherein before entering the sleep mode, the second second-tier base station transmits an indication representative of the duration of the preselected interval to the remote unit.
- 50. (Previously presented) The system of claim 49, wherein the duration of the preselected interval is defined by a start and end time of the preselected interval.
- 51. (Previously presented) The system of claim 48, wherein the first-tier base station is wirelessly coupled to the first second-tier base station, and wherein the first second-tier base station has a shorter transmission range relative to the first-tier base station.

08/12/2004 14:28 WMA → USPTO NO.454 D10

52. (Previously presented) The system of claim 34, wherein the first-tier base station is wirelessly coupled to the first second-tier base station, and wherein the first second-tier base station has a shorter transmission range relative to the first-tier base station.

53. (Previously presented) The system of claim 34, wherein the second second-tier base station is adapted to:

transmit an associate command to the remote unit;

receive a message from the remote unit in response to the associate command, wherein the message comprises an identifier associated with the remote unit; and transmit a synchronization interval to the remote unit in response to receiving the message.

54. (Previously presented) The system of claim 48, wherein the second second-tier base station is adapted to:

transmit an associate command to the remote unit;

receive a message from the remote unit in response to the associate command, wherein the message comprises an identifier associated with the remote unit; and transmit a synchronization interval to the remote unit in response to receiving the message.

55. (Currently Amended) A multi-tier system for digital radio communication, comprising:

a processor-based host adapted to control a remote unit;

08/12/2004 14:28 WMA → USPTO NO.454 P11

a first-tier base station communicatively coupled to the host, wherein the first-tier base station operates in accordance with a first communications protocol;

- a first second-tier base station communicatively coupled to the first-tier base station,

  wherein the first second-tier base station and the first-tier base station

  communicate using the first communications protocol; and
- a second second-tier base station wirelessly coupled to the first second-tier base station, wherein the second second-tier base station is intermediate the first second-tier base station and the remote unit, and wherein the second-tier base stations have a shorter transmission range relative to that of the first-tier base station,

wherein the host is adapted to control the remote unit through the first-tier base station, the first second-tier base station, and the second second-tier base station.

- 56. (Previously presented) The system of claim 55, wherein the second second-tier base station is adapted to go into a sleep mode for a preselected interval, wherein before entering the sleep mode, the second second-tier base station transmits an indication representative of the duration of the preselected interval to the remote unit.
- 57. (Previously presented) The system of claim 56, wherein the duration of the preselected interval is defined by a start and end time of the preselected interval.
- 58. (Previously presented) The system of claim 55, wherein the second second-tier base station is adapted to:

transmit an associate command to the remote unit;

08/12/2004 14:28 WMA  $\rightarrow$  USPTO NO.454 **D1**2

receive a message from the remote unit in response to the associate command, wherein the message comprises an identifier associated with the remote unit; and transmit a synchronization interval to the remote unit in response to receiving the message.
